Mini Silo

Date: 10.02.2010

Mini Solution:

You can start off with a mini silo, either a prefabricated or a Do It Yourself silo. If needed, a ceiling conveyor can be connected for longer transport distances.

Matene Mini with vertical conveyor.

Mini Silo - Do It Yourself Solution:

You need to purchase Matene motors and coils for the feed system and also receive detailed instructions on how to mount the feed system. You purchase the conveyor pipes and parts from Bauhaus (in Sweden alternatively "Jula").

The mini silo measures 60cmx100cm and is 137 cm high. Small foot print but the volume is effectively high, 550 liters, due to the vertical conveyor and double inlets in the silo conveyor. Add one extra section, and the filling volume is up to 1100 liters. And the best thing with it: You can reuse the conveyors for a large bulk silo that you build later on.

The vertical conveyor is air tight stopping all fumes/exhaust gases from entering the silo and it feeds the burner at accurate capacity.
